

## INSTRUCTIONS

All measurements must be made with a flexible 1/4 inch steel tape or cable to the nearest one-eighth (1/8) of an inch. To simplify, please enter fractional figures in eighths.

**DO NOT** use cable to measure circumferences, lengths only.

Official measurements cannot be taken for at least **SIXTY (60)** days after the animal was killed. The trophy must first have been stored under normal room temperature and humidity for at least **60 consecutive days**. No trophy will be considered which has in any way been altered from its natural state.

Please submit **photographs**. All entries must include photographs of the trophy. Photos of right side, left side and front views are **required**. A photo at kill site if possible.

**Supplementary data measurements** indicate conformation of the trophy. The figure in line A is not to be included in the score. Evaluation of conformation is a matter of personal preference.

**A. Tip to Tip Spread** is measured between tips of horns.

**B. Length of Horns** is measured by placing the end of the tape where the horn meets the skull on the top side of the horn. The tape should be held on the ridge of the horn throughout the measurement. The tape should be wrapped around the horn from the base to the tip.

**C-1. Measure around base of horn** at right angles to long axis. Tape must be in contact with the lowest circumference of the horn in which there are no serrations.

**C-2-3-4. Divide measurement of LONGER horn** by four; mark **BOTH** horns at these quarters even though one horn is shorter, and measure circumferences at these marks.
