

INSTRUCTIONS

All measurements must be made with a flexible 1/4 inch steel tape or cable to the nearest one-eighth (1/8) of an inch. To simplify, please enter fractional figures in eighths.

DO NOT use cable to measure circumferences, lengths only.

Official measurements cannot be taken for at least **SIXTY (60)** days after the animal was killed. The trophy must first have been stored under normal room temperature and humidity for at least **60 consecutive days**. No trophy will be considered which has in any way been altered from its natural state.

Please submit **photographs**. All entries must include photographs of the trophy. Photos of right side, left side and front views are **required**. A photo at kill site if possible.

Supplementary data measurements indicate conformation of the trophy. The figures in line A and B are not to be included in the score. Evaluation of conformation is a matter of personal preference.

A. Greatest Spread is measured between perpendiculars at right angles to the center line of the skull.

B. Tip to Tip Spread is measured between tips of horns.

C. Length of Horns is measured from lowest point in front over outer curve to a point in line with tip.

D-1. Circumference at Base is measured at right angles to the axis of the horn. **DO NOT** follow the irregular edge of the horn. Tape must be completely on horn material.

D-2-3-4. Divide measurement C of LONGER horn by four; mark **BOTH** horns at these quarters even though the other horn is shorter, and measure circumferences at these marks.
